

How to Access Root Robot Project Codes When Lesson Links Aren't Working

If a Root lesson link isn't opening the project directly, you can still access all Root codes manually using this quick workaround provided by our Product Team. This method works for any Root project linked inside our Learning Library lessons.

✓ Step 1: Copy the Project Code From the Lesson Link

1. Locate the lesson resource link that normally opens the Root project.
2. Right-click the link.
3. Select "Copy Link Address."

It will look something like this: <https://code.irobot.com/?project=6M24A>

4. The project code is the last part after `project=`
 - Example: the code is 6M24A

 *Each lesson link will have its own unique project code.*

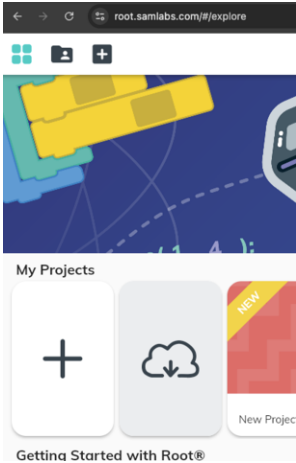

✓ Step 2: Open the Root Coding Platform

Go to:  <https://root.samlabs.com/#/explore>

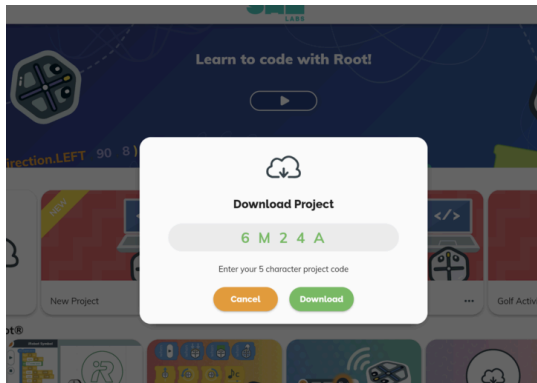

You will see your Root Explore Page with project tiles.

✓ Step 3: Manually Enter the Project Code

1. Click the Download / Import Project button (cloud with down-arrow icon).

2. A pop-up will appear with a space to enter a project code

3. Paste the code you copied earlier (example: 6M24A).

4. Press Enter or Submit. The Root project will load instantly!
